Use CRYPTISA to encrypt, shred, lock or hide a file instantly from your desktop. With the new feature HideFile, your files are hidden using a second document for each one, so the two files do not show up in the Windows Explorer and your desktop. Simple and easy to use. Simply create a password for your file and hide it behind a second document. While CRYPTISA is encrypting your file, it will be securely shredded, making it useless to anyone else. The shredder shreds your file before encrypting it with a strong cypher. Encrypt a file and then hide it with a second document. Create and manage passwords. Add passwords to your files and the program will safely save them in a secure file. Change or revoke a password at any time. You can set the size of the password, set the number of characters in a password and

the number of retries. Your password is not stored in the database, only a hash of it is. Password strength measures. The password strength of your password can be determined easily. Use the in-depth password manager. The password manager can store and manage multiple passwords, passwords with different characters and special characters. Password generator. This feature allows you to generate a new password and set it as the password for a file. Use in batch mode. Batch processing enables you to encrypt a large number of files at once. You can specify the file type, file size, number of files, password strength and a password policy. The CRYPTISA encryption option allows you to create a hash value of a password to use it as a file protection. A hash is a mathematical representation of a password. As CRYPTISA is using the Windows Cryptography API to handle the encryption it also allows you to export the hash in a file and save it to a password protected file. Please

keep in mind that all the data written in the database will be in encrypted form. Features: - Encryption - On screen virtual keyboard (comes with Win95) - Password strength (please, remember that each password is only hashed, not encrypted! With a Password Policy you can have the program encrypt them all at once!) - Encryption progress - Password manager - Password Policy - Batch processing - File shredder - Password masking (This is useful when you have a couple of files with the same password, and you want to protect them with different documents) -
