The invention relates to a method of making a toner for developing an electrostatic image formed on an electrostatic image-carrying member, which is suitable for electrophotographic copying machines, facsimiles, and laser printers, and a toner for developing electrostatic image by using such a toner making method.

In electrophotographic copying machines, facsimiles, and laser printers, toners are generally used to visualize electrostatic images formed on an image-carrying member. In these toners, as well as the amount of charge on toner particles and the polarity of the toner particles, the degree of hardness of the toner particles and the triboelectricity of the toner particles are controlled. As for toners for developing electrostatic images, a toner comprising a binder resin containing an ester derivative of a carboxylic acid and an amine derivative is disclosed in Japanese Patent Application Laid-Open No. 109331/1989 and a toner comprising a toner binder and a polyester and/or a polyester derivative is disclosed in Japanese Patent Application Laid-Open No. 83096/1989. The present inventors have assiduously studied on an environment-friendliness of organic substances contained in toners. A toner for developing electrostatic images comprising a binder resin containing an ester derivative of a carboxylic acid and an amine derivative which is disclosed in Japanese Patent Application Laid-Open No. 109331/1989 contains an organic substance of a polyester derivative in a large quantity. As a result, it is found that an organic substance having a large molecular weight imparts to the toner particles an increased degree of hardness and that the diffusion of the organic substance in the toner particles may possibly retard the diffusion of ozone decomposed from the ozone generator, and make the bonding force between the binder resin and the toner particles lower, thereby making the toner particles liable to be pulverized by external forces or to be scratched by particles, resulting in a scattering of toner. The present inventors have also studied on a method of producing a toner bff6bb2d33

Application of Loess Plate for the treatment of heavy metal co-contaminated water samples: Free Cu(II) removal; recovery, stability and characterization. This study focuses on the applicability of Loess Plate (Loess P) for co-contaminated water samples. Loess P was found to be an efficient and economic sorbent for the removal of free Cu(II) from water, where maximum removal of 16 mM by Loess P was achieved. Loess P can be used as a new low-cost sorbent for efficient purification of industrial effluents, raw water, and seawater. The maximum removal of Cu(II) at neutral pH was achieved at a Loess P loading of 8 g/L, followed by 4 g/L. Removal efficiency was maximum at a Loess P loading of 8 g/L. Desorption studies, speciation of ions, adsorption kinetics, and regeneration studies were investigated with a view to achieve this maximum removal efficiency. The effects of pH, initial concentration, contact time, ionic strength, and temperature on the removal efficiency were investigated. Removal of free Cu(II) from the sample was found to be maximum at pH = 8.0. The removal of copper was effectively achieved at a Loess P loading of 8 g/L. Removal efficiency was independent of initial concentrations of Cu(II) except at a high initial concentration. The maximum adsorption was 4.37 ± 0.01 mg/g within 10 min, and the equilibrium time was 15 min. Increase in the ionic strength resulted in an increase in the adsorption of Cu(II). The adsorption process can be described by pseudo first-order kinetics. The adsorption rate constant obtained from the study was 0.0393 min^{-1} . The free adsorption was
